$2.95

SEMICONDUCTORS

3,500 NTE Semiconductors Cross-Referenced to over 250,000 U.S., Japanese and European Part Numbers. Includes Technical Information!

6TH EDITION

Semiconductors, Capacitors, and Flameproof Resistors:

- Industrial
- Consumer
- Commercial
- And MRO Applications

SUGGESTED PRICE $4.95

The NTE line of replacement semiconductors is both vast and comprehensive. It covers everything from A/D Converters to Zener Diodes and all are backed by our exclusive 2 year warranty. Now containing over 3,500 types, the NTE line is able to replace over 250,000 industry part numbers including JEDEC, JAPANESE, EUROPEAN and many commercial and industrial house number types.

Types included are:

BIPOLAR TRANSISTORS

Silicon & Germanium
Collector Currents to 60 Amps
Breakdown Voltages to 2500 Volts
Darlington & Non-Darlington
Frequencies up to 5 GHZ

FIELD EFFECT TRANSISTORS

N-Channel & P-Channel
JFET & MOSFET
Single & Dual Gate
Power MOSFET

ZENER DIODES

Wattages from 1/2 Watt to 50 Watts
Voltage Range: 2.4 V to 200 V all ±5%

DIODES & RECTIFIERS

Silicon, Germanium and Selenium
Average Forward Current to 30 Amps
Peak Reverse Voltages to 6000 Volts
Standard and Fast Recovery
Dual Rectifiers
Schottky Barrier Rectifiers

BRIDGE RECTIFIERS

1 Amp to 100 Amps
100 Volts to 1000 Volts

INDUSTRIAL RECTIFIERS

3 Amps to 2200 Amps
50 Volts to 1600 Volts

SILICON CONTROLLED RECTIFIERS (SCR'S)

$I_{T(RMS)}$: 0.8 Amp to 1800 Amps
V_{DRM}: 25 Volts to 1200 Volts
Phase Control & High Speed types

TRIACS

$I_{T(RMS)}$: 0.8 Amps to 45 Amps
V_{RRM}: 25 Volts to 1000 Volts

METAL OXIDE VARISTORS (MOV'S)

RMS Voltage: 10 Volts to 480 Volts
Peak Current: 250 Amps to 6500 Amps

OPTOELECTRONICS

Discrete LED Indicators
Optoisolators, Transistors, Darlingtons, SCRs, Triacs, Logic Gate Outputs
Opto Interrupters
LED Displays
Bar Graph Displays
LED Arrays
Infrared Emitting Diodes
Phototransistors

INTEGRATED CIRCUITS

Voltage Regulators: Positive, Negative and Adjustable
Audio Power Amps
Comparators
OP-Amps
TV and VCR Circuits
Oscillators
Preamps
CMOS (4000 & 4500 Series)
TTL (74, 74C, 74H, 74LS, 74S)
Display Drivers
Microprocessors
Memory Circuits

EXCLUSIVE 2 YEAR WARRANTY

NTE products are warranteed to be free from defects in materials & workmanship and meet applicable specifications when tested to ratings. This warranty is in lieu of any other warranty expressed, implied or statutory. NTE's liability under this warranty is limited to repairing, replacing or issuing credit (at the discretion of NTE) for such products as become defective or fail to meet specification during the warranty period of two years from date of sale. The technical data shown is intended to provide safe areas of operation for the NTE products. Determination as to whether a product is actually defective rests with NTE. In no event will NTE be liable for consequential or special damages.

SAFETY WARNING:
NTE devices are not to be used as critical components in life support equipment. Testing of solid state devices should be performed by experienced persons using test instruments designed for such purposes. Typical test instruments would include VOM's, transistor testers and curve tracers. Line voltage should not be applied directly to a device under test.

Information and specifications furnished by NTE are believed to be accurate and reliable. However, NTE neither implies nor guarantees that items listed in replacement directories are exact replacements in all applications. NTE assumes no responsibility for its use, nor for any infringements of patents or other rights of third parties which may result from such use. No license is granted by implication or otherwise under any patent rights of NTE or others. Reproduction without express permission of editorial or pictorial content in any manner, is prohibited.

NOTES

NTE REPLACEMENT CONSIDERATIONS

NTE Application Information:

- **NTE** solid state devices are first quality. In many cases these devices far exceed the original manufacturer's specification. When using NTE parts for your replacement needs, you are assured of quality and reliability.
- **NTE** devices may be used for new designs. This will ensure replacement availability and confidence in your product.
- **NTE**'s Engineering Department and test facilities will assist you whenever possible with product information. Contact your local distributor or write **NTE** directly for information.

General Replacement Notes:

- Use equal or greater breakdown voltage
- Use equal or greater operating current
- Use equal or greater power dissipation
- Use equal or greater gain bandwidth product
- Use equal or lower switching time
- Use equal or lower trigger current
- Use equal or lower reverse current

Before replacing an original equipment device with the recommended **NTE** device, the following basic factors should be considered:

- Compare the lead or terminal arrangement of the original device with the lead or terminal arrangement of the **NTE** replacement device. If this arrangement is different, bend the leads of the **NTE** transistor so that the base, emitter, and collector leads will mate with the corresponding terminals and insulate the leads if necessary to prevent shorting.

Matched Pairs of Transistors

- When one transistor in a push–pull power amplifier stage becomes inoperative, the resulting circuit imbalance may produce very large changes in the operating conditions for that stage. These changes will depend on the cause and nature of the failure and may cause damage to associated circuit components, including the other transistor(s) in that stage. Therefore, it is advisable to replace both or all transistors is a push–pull power amplifier stage. When one or more of the transistors becomes inoperative, it is generally advisable to replace them with a matched pair even though the service data for the equipment does not specifically indicate that a matched pair should be used.

Silicon Rectifiers

- Silicon Rectifiers are inherently more efficient than selenium or other metallic–oxide type rectifiers. When a selenium rectifier in the "B" supply of a typical line–operated radio or TV receiver is replaced with a silicon rectifier, the silicon rectifier will frequently deliver from 25 to 50 volts higher DC output voltage than the original device. To prevent damage, it is generally advisable to insert a power resistor in series with the silicon rectifier, therefore, on the input side, between the AC supply and the rectifier, or on the output side between the rectifier and the first filter capacitor.

High Voltage Multipliers

- Before replacing an original equipment high–voltage tripler, compare the lead arrangement of the tripler being replaced and note carefully the connection lead positions with respect to other circuit components. These details should be duplicated as precisely as possible when installing the **NTE** replacement.
- Certain original equipment triplers incorporate exposed, non–used focus terminals. When these units are replaced with **NTE** devices, it is imperative to cover the unused terminal with silicon sealant to prevent arcing.

Horizontal Deflection Circuits

- Before replacing a defective Horizontal Output Transistor in a television circuit, carefully check all other associated circuit components. For example, Driver, Horizontal Oscillator, Flyback Transformer, High Voltage Multipliers, and any Resistors or Capacitors. Failure to do so can cause immediate damage to the new replacement.

Special Handling Instructions

1. **Lead Forming**
   At times it may be necessary to form the leads of the replacement device due to different lead configurations or for PCB mounting. To properly form a lead, place a pointed nose or duck–bill pliers between the body of the part on the lead where you want the bend to occur. Bend the lead against the pliers on the side opposite the body of the part. This procedure will eliminate placing any stress where the lead joins the body of the part and prevent the glass or plastic from cracking. In forming any lead, always use as large a radius as possible.

2. **CMOS and MOSFET Handling**
   CMOS and MOSFET devices currently being produced are utilizing internal protection against electrostatic discharge. However, to ensure proper handling, note the following recommendations:

   A. Personnel handling these devices should wear a wrist strap that is connected to the ground through a 1 Megohm Resistor.

   B. The tips of the soldering irons used should be grounded.

   C. Devices should not be removed with the power on.

   D. Leave the conductive foam on the device until ready for insertion in the circuit.

   The approach you take toward static discharge should be influenced by the following considerations that have been investigated by the industry

   These apply to anyone who handles electrostatic–sensitive devices– particularly the technician providing service.

   Static electricity is always present and can be influenced by common, every–day actions. Some of these are:

   1. Walking across a carpet
   2. Walking over a vinyl floor
   3. Technician at a work bench
   4. Vinyl envelopes for work instructions
   5. Common poly–bag picked up from a work bench
   6. Work chair padded with urethane foam

   Considerations should be given to the work environment. Numerous types of materials can significantly influence the generation of static electricity. Some of these you undoubtedly come in contact with everyday.

   WORK SURFACES: Melamine Laminates (waxed or highly resistive); Finished Wood; Synthetic Mats

   FLOORS: Waxed; Vinyl; Carpeting

   CLOTHES: Common clean room stacks; Personnel garments (all textiles except virgin cotton)

   PACKAGING AND HANDLING: Plastic–bags, wraps, envelopes; Bubble pack, foam; plastic trays, plastic tote boxes, vials, parts bins

   ASSEMBLY, CLEANING, TEST AND REPAIR AREAS: Spray cleaners; Common solder suckers; Common solder irons; Solvent brushing (synthetic bristles); Cleaning, drying; Temperature chambers; Cryogenic sprays; Heat guns and blowers; Sand blasting; Electrostatic copiers

Soldering Precautions

- Extreme care should always be used when making solder connections to semiconductors. Momentary application of excessive heat or even prolonged application of a properly heated soldering tool to a semiconductor lead or terminal can permanently damage the device. Always observe the following precautions in soldering to a semiconductor lead or terminal:

  1. Solder as far as possible from the body of the semiconductor.
  2. Never apply molten solder or a hot soldering tool to a lead or terminal for longer than 10 seconds or at a point closer than 1/16 (1.59mm) to the body of the device.
  3. Use a small soldering iron, preferably one specifically intended for use with transistors or miniature components.
  4. Keep the surfaces to be soldered clean and the tip of the soldering tool adequately tinned so that the connection can be made as quickly as possible.
  5. Always grab the lead or terminal to be soldered with a pair of long–nose pliers at a point between the intended solder connection and the case or body of the semiconductor. This precaution allows the pliers to act as a heat sink and conduct the heat away from the semiconductor.

MOUNTING TECHNIQUES

FOR POWER SEMICONDUCTORS

Introduction

Current and power ratings of semiconductors are inseparably linked to their thermal environment. Except for lead–mounted devices used at low currents, a heat sink is required to prevent the junction temperature from exceeding its rated limit, thereby running the risk of a high failure rate.

Many failures of power semiconductors can be traced to faulty mounting techniques. With metal packaged devices, faulty mounting generally causes unnecessarily high junction temperature, resulting in reduced component life. With the widespread use of various plastic packaged semiconductors, proper techniques are even more important.

In many situations, the case of the semiconductor must be isolated electrically from its mounting surface. The isolation material is, to some extent, a thermal isolator as well, which raises junction operating temperatures. In addition, the possibility of arc–over problems is introduced if high voltages are being handled. Electrical isolation thus places additional demands upon the mounting procedures.

Proper mounting procedures necessitate attention to the following areas:

1. Mounting surface preparation
2. Application of thermal compounds
3. Installation of the insulator
4. Fastening of the assembly
5. Lead bending and soldering

Mounting Surface Preparation

In general, the heat sink mounting surface should have a flatness and finish comparable to that of the semiconductor package. In lower power applications, the heat sink surface is satisfactory if it appears flat against a straight edge and is free from deep scratches. In high power applications, a more detailed examination of the surface is required.

Thermal Compounds/ THERMO–PADS*

To improve contacts between power semiconductors and their heat sinks, thermal joint compounds or THERMO–PADS are used to fill air voids between mating surfaces. Joint compounds are a formulation of fine zinc particles in silicon oil which maintains a grease–like consistency with time and temperature. NTE has thermal compound available in 1 gram tubes (NTE303). Since some of these compounds do not spread well, they should be evenly applied in a very thin layer using a spatula or lintless brush, and wiped lightly to remove excess material. Some circular rotation of the packages will help the compound spread evenly over the entire contact area. Experience will indicate whether the quantity is sufficient, as excess will appear around the edges of the semiconductor. To prevent accumulation of airborne particulate matter, excess compound should be wiped away using a cloth moistened with acetone or alcohol.

These solvents should not contact plastic–encapsulated devices, as they may enter the package and cause a leakage path or carry in substances which might attack the assembly. The rougher the surface, the more valuable the grease becomes in lowering contact resistance; therefore, when mica insulating washers are used, the use of grease is generally mandatory. The thermal compound also improves the breakdown voltage rating of the insulator and is therefore highly desirable.

THERMO–PADS are thermally conductive insulators offering low heat transfer resistance while still providing high electrical isolation between the parts of the assembly. The elastomeric material combines the electrical isolation of rigid insulators with the ability to conform to rough surfaces and reduce contact in much the same manner as thermal greases. Proper selection and use of these THERMO–PADS results in a securely–mounted power semiconductor and minimum resistance to the heat transfer between it and the heat sink.

Insulation Consideration

Since it is most expedient to manufacture semiconductors with collectors or anodes electrically common to the case, the problem of isolating the case from ground is a common one. For lowest overall thermal resistance, it is best to isolate the entire heat sink structure from ground, rather than to use an insulator between the semiconductor and the heat sink. Where heat sink isolation is not possible, insulators are used to isolate the individual components from the heat sink. When using insulators, care must be taken to keep the mating surfaces clean. Small particles of foreign matter can puncture the insulation, rendering it useless or seriously lowering its dielectric strength. In addition, particularly when voltages higher than 300 volts are encountered, problems with creepage may occur. Dust and other foreign material can shorten creepage distances significantly so that having a clean repair area is important. Use of thermal grease usually raises the breakdown voltage of the insulation system.

Mounting Techniques

1. **Stud Mount:**
Mounting errors with stud mounted parts are generally confined to the application of excessive torque or tapping the stud into a threaded heat sink hole. Both of these practices may cause a warpage of the hex base which may crack the internal semiconductor chip. The best fastening is to use a nut and washer as shown in Figure 1.

2. **TO3/TO66:**
Few known mounting difficulties exist with this type of package. The rugged base and distance between the chip and mounting holes combine to make it difficult to cause any warpage unless mounted on a heat sink which is badly bowed or unless one side is tightened excessively before the other side. A typical mounting installation is shown in Figure 2.

3. **Press–Fit:**
The hole edge must be chamfered as shown in Figure 3 to prevent shearing off the knurled edge of the case during press–in. The press–in force should be applied evenly on the shoulder ring to avoid tilting of the case in the hole during the pressing operation. Also, the use of a thermal compound will be of considerable aid. The pressing force will vary from 250 to 1000 pounds, depending upon the heat sink material. A heat sink as thin as 1/8 inch may be used, but the interface thermal resistance will increase in direct proportion to the contact area. A thin chassis requires the addition of a back–up plate.

4. **Disk–Type (Hockey Puck):**
A self–leveling type mounting clamp is recommended to assure parallelism and even distribution of pressure on each contact area. A swivel type clamp or narrow leaf spring in contact with the heat dissipator will provide acceptable performance.
The clamping force should be applied smoothly, evenly, and perpendicular to the semiconductor package to prevent deforming the device or the heat dissipator mounting surfaces during installation. The spring used should provide a mounting force within the range specified by the clamping force. The clamping forces usually range from 800 to 2000 pounds, depending on the part number.

   Installation of an assembly of disk–type semiconductors mounted between two heat dissipators should be done in a manner to permit one heat to move with respect to the other. Movement will avoid stresses being developed due to thermal expansion, which could damage the semiconductor.

5. **TO126/TO127:**
Success in mounting these devices depends largely upon using a compression washer which provides a controllable pressure across a large bearing surface. Having a small hole with no chamfer and a flat, burr–free, well–finished heat sink are also important.

   Several types of fasteners may be used to secure these packages. Machine screws, eyelets, or clips are preferred. Screws should not be tightened with any type of air–driver torque gun or equipment which may cause high impact. Use of the clip requires that caution be exercised to insure adequate mounting force is applied.

   When electrical isolation is required, a bushing inside the mounting hole will ensure the screw has no contact with the metal base.

6. **TO220, Tab Mount:**
The popular TO220 package also requires attention to mounting details. Flange distortion is possible if excessive torque is used during mounting. A maximum torque of 8 inch–pounds is suggested in using a 6–32 screw. Care should be exercised to assure that the tool used to drive the mounting screw never comes in contact with the plastic body during the tightening operation. Such contact can result in damage to the plastic body and internal device connections.

7. **R.F. Power:**
Beside the usual precautions regarding surface flatness and torque, the R.F. Disk–Package requires special attention to the following:

   A. The devices should never be mounted in such a manner as to place ceramic to metal joints in tension.

   B. The device should never be mounted in such a manner as to apply force on the strip leads in a vertical direction towards the ceramic cap.

   C. The device should be properly secured into the heat sink before the device leads are attached to the circuit.

   D. The leads must not be used to prevent device rotation during the stud torque application.

   The joint between the ceramic cap and the BeO ceramic disk is composed of a material which loses strength above 175°C. While the strength returns upon cooling, any force applied to the cap at high temperature may result in failure of the cap to ceramic joint.

NOTE: 10 Watt and 50 Watt Zeners listed have Anode (Standard Polarity) connected to stud. Add suffix letter "K" to the NTE number for Cathode (Reverse Polarity) connected to stud (ex. NTE5175AK). The NTE type numbers shown have a standard tolerance for the Zener Voltage of ±5%.

THYRISTORS

NTE's thyristor family consists of several different device types. The most widely used of this family are Silicon Controlled Rectifiers (SCR's), TRIAC's, and DIAC's.

The following glossary represents the most widely used thyristor terms and definitions:

GENERAL TERMINOLOGY

On–State

The condition of the thyristor corresponding to the low–resistance, low–voltage portion of the principal voltage–current characteristic in the switching quadrant(s).

Off–State

The condition of the thyristor corresponding to the high–resistance, low–current portion of the principal voltage–current characteristic between the origin and the break–over point(s) in the switching quadrant(s).

Breakover Point

Any point on the principal voltage–current characteristic for which the differential resistance is zero and where the principal voltage reaches a maximum value.

Principal Current

A generic term for the current through the collector junction. Note: It is the current through main terminal 1 and main terminal 2 of a TRIAC of anode and cathode of an SCR.

Principal Voltage

The voltage between the main terminals. Note: (1) In the case of reverse blocking thyristors, the principal voltage is called positive when the anode potential is higher than the cathode potential, and called negative when the anode potential is lower than the cathode potential. (2) For bidirectional thyristors, the principal voltage is called positive when the potential of main terminal 2 is higher than the potential of main terminal 1.

SPECIFIC TERMINOLOGY

Breakover Voltage ($V_{(BO)}$)

The principal voltage at the breakover point

Repetitive Peak Off–State Voltage (V_{DRM})

The maximum instantaneous value of the off–state voltage which occurs across a thyristor, including all repetitive transient voltages, but excluding all non–repetitive transient voltages.

Repetitive Peak Reverse Voltage of an SCR (V_{RRM})

The maximum instantaneous value of the reverse voltage which occurs across a thyristor, including all repetitive transient voltages, but excluding all non–repetitive transient voltages.

On–State Voltage (V_T)

The principal voltage when the thyristor is in the on–state.

Gate Trigger Voltage (V_{GT})

The gate voltage required to produce the gate trigger current.

Breakover Current ($I_{(BO)}$)

The principal current at the breakover point.

Repetitive Peak Off–State Current (I_{DRM})

The maximum instantaneous value of the off–state current that results from the application of repetitive peak off–state voltage.

Repetitive Peak Reverse Current of an SCR (I_{RRM})

The maximum instantaneous value of the reverse current that results from the application of repetitive peak reverse voltage.

On–State Current (I_T)

The principal current when the thyristor is in the on–state.

Surge (Non–Repetitive) On–State Current (I_{TSM})

An on–state current of short–time duration and specified waveshape.

Latching Current (I_L)

The minimum principal current required to maintain the thyristor in the on–state immediately after switching from the off–state to the on–state has occurred and the triggering signal has been removed.

Holding Current (I_H)

The minimum principal current required to maintain the thyristor in the on–state.

Gate Trigger Current (I_{GT})

The minimum gate current required to switch a thyristor from the off–state to the on–state.

Peak Gate Power Dissipation (P_{GM})

The maximum power which may be dissipated between the gate and main terminal 1 (or Cathode) for a specified time duration.

Average Gate Power Dissipation ($P_{G(AV)}$)

The value of gate power which may be dissipated between the gate and main terminal 1 (or cathode) averaged over a full cycle.

Gate–Controlled Turn–On Time (t_{gt})

The time interval between a specified point at the beginning of the gate pulse and the instant when the principal voltage (current) has dropped (risen) to a specific low (high) value during switching of a thyristor from the off–state to the on–state by a gate pulse.

Circuit–Commutated Turn–Off Time (t_q)

The time interval between the instant when the principal current has decreased to zero after external switching of the principal voltage circuit, and the instant when the thyristor is capable of supporting a specified principal voltage without turning on.

Critical Rate of Rise of Off–State Voltage (Critical or Static dv/dt)

The minimum value of the rate of rise of the principal voltage which will cause switching from the off–state to the on–state.

Critical Rate of Rise of On–State Current (di/dt)

The maximum value of the rate of rise of on–state current which a thyristor can withstand without deleterious effect.

Critical Rate of Rise of Commutation Voltage of a TRIAC (Commutating dv/dt)

The minimum value of the rate of rise of principal voltage which will cause switching from the off–state to the on–state immediately following on–state current conduction in the opposite quadrant.

Thermal Resistance, Junction to Ambient ($R_{\theta JA}$)

The temperature difference between the thyristor junction and the ambient divided by the power dissipation causing the temperature difference under conditions of thermal equilibrium. Note: Ambient is defined as the point where the temperature does not change as a result of the dissipation.

Thermal Resistance, Junction to Case ($R_{\theta JC}$)

The temperature difference between the thyristor junction and the thyristor case divided by the power dissipation causing the temperature difference under conditions of thermal equilibrium.

DESCRIPTION:

The NTE5424 is an all–diffused silicon controlled rectifier (reverse–blocking triode thyristor) intended for high speed switching applications such as power inverters, switching regulators, and high current pulse applications. This device features fast turn–off, high dv/dt, and high di/dt characteristics and may be used at frequencies up to 25kH$_Z$.

Features:

- Fast turn–off time (t_q) = 6μs Max.
- High di/dt and dv/dt capabilities
- Shorted–emitter gate–cathode construction (contains an internally diffused resistor between the gate and cathode)
- Low thermal resistance
- Center–gate construction (provides rapid uniform gate–current spreading for faster turn–on with substantially reduced heating effects)

DESCRIPTION:

The NTE308 and NTE310 series integrated thyristor/rectifiers are all–diffused power monolithic circuits that incorporate a silicon controlled rectifier and a silicon rectifier on a common pellet. The NTE308 series types are used as bipolar switches to control horizontal yoke current during the beam trace interval; the NTE310 series types are used as commutating switches to initiate trace–retrace switching.

DESCRIPTION:

The NTE5646 is a TRIAC that includes a DIAC trigger mounted inside the same package. This device saves the user the expense and assembly time of buying a discrete DIAC and assembling in conjunction with a gated TRIAC. The NTE5646 is a bidirectional AC switch and is gate controlled for either polarity of main terminal voltage.

POWERBLOCK NOTES:

MOUNTING: Careful mounting of powerblocks on the heatsink is one of the most important requirements of reliable satisfactory application.

The contact surfaces of powerblock and heatsink must be clean, free from contamination and damage. Finish and flatness of heatsink contact surface should be ≤10µm.

A thin and uniform film of interface thermal compound should be applied to contact surface of powerblock and heatsink.

Fixing bolts have to be uniformly tightened with the specified mounting torque. Cross sections of busbars or cables have to be dimensioned so that heating up the powerblock will be avoided. This applies in particular for series connected fuses.

MAINTENANCE: Powerblocks are maintenance–free. The assembly group should, however, be cleaned from time to time to ensure the insulation capability, the heat dissipation and thus the availability of the power converter.

WARNING: Beryllium oxide is used in the powerblock assembly for insulation. Do not destroy the powerblock case because the beryllium oxide dust resulting from such action is hazardous if inhaled.

DESCRIPTION:

This device has been characterized as a Programmable Unijunction Transistor (PUT), offering many advantages over conventional unijunction transistors. The designer can select R_1 and R_2 to program unijunction characteristics such as η, R_{BB}, I_P, and I_V to meet particular needs. Applications of the PUT include timers, high gain phase control circuits, and relaxation oscillators.

DESCRIPTION:

Silicon Bilateral Switches are specifically designed and characterized for applications where stability of switching voltage over a wide temperature range and well matched bilateral characteristics are an asset. They are ideally suited for half wave and full wave triggering in low voltage SCR and TRIAC phase control circuits.

Storage Temperature: –30° to +30°C
Junction Temperature: +125°C

DESCRIPTION:

The SIDAC is a silicon bilateral voltage triggered switch with greater power handling capabilities than standard DIACs. Upon application of a voltage exceeding the SIDAC breakover voltage point, the SIDAC switches on through a negative resistance region to a low on–state voltage. Conduction will continue until the current is interrupted or drops below the minimum holding current of the device.

Applications:

- High voltage lamp ignitors
- Natural gas ignitors
- Gas oil ignitors
- High voltage power supplies
- Xenon ignitors
- Overvoltage protection
- Pulse generators
- Fluorescent lighting ignitors

6405	TO98	386	14	18	7	9	80	10	1.6	100	200	500	350	1	30

DESCRIPTION:

The NTE6405 is an asymmetrical AC trigger integrated circuit for use in TRIAC phase controls. This device greatly reduces the snap–on effects that are present in symmetrical trigger circuits and minimizes control circuit hysteresis. This performance is possible with a single RC time constant, whereas a symmetrical circuit of comparable performance would require at least three additional passive components.

			Min	Max								
6404	TO98	5	7	9	200	0.75	300	175	1	1.5	1	25

DESCRIPTION:

The NTE6404 is a silicon planer, monolithic integrated circuit having thyristor electrical characteristics closely approximating those of an "ideal" four layer diode. This device is designed to switch at 8V with a 0.02%/°C temperature coefficient. A gated lead is provided to eliminate rate effect, obtain triggering at lower voltages and to obtain transient free wave forms.

Silicon Unilateral Switches are specifically designed and characterized for use in monostable and bistable applications where low cost is of prime importance.

Applications:

- SCR triggers
- Frequency dividers
- Ring counters
- Cross point switching
- Overvoltage sensors

6412	130	63 ± 7	100	2	6	250

DESCRIPTION:

The NTE6407, NTE6408, NTE6411, and NTE6412 bilateral trigger DIACs offer a range of voltage characteristics from 28 to 63 Volts.

The DIAC semiconductor is a full–wave or bidirectional thyristor. It is triggered from a blocking–to–conduction state for either polarity of applied voltage exceeds the breakover voltage rating of the DIAC.

SELECTING THE PROPER MOV VOLTAGE RATING:

1. **Determine the required voltage rating.**
   First, the maximum steady–state operating voltage of the circuit must be determined. Care must be taken to use the upper tolerance limit of the voltage source, e.g., for a 220VAC line,a 10% high line condition should be assumed, resulting in 242 Volts. Once the level is determined, refer to the column in the data table headed "Maximum Continuous Voltage" and select a group having the nearest greater value to this level.

IC PROTECTORS (ICP)

Description:

The IC Protector (ICP) is an overcurrent protection device having stable and high–speed circuit tripping characteristics which enables these devices to shut off the circuit quickly and safely. This quick shut–off response protects valuable semiconductor devices and circuits from common load short–circuit failures.

Features:

- Precise and extremely stable cut–off characteristics
- Small internal resistance with low voltage drop
- Nonflammable
- Compact

Applications:

- Overcurrent protection

THERMAL CUTOFFS

(THERMAL FUSES)

THERMAL CUT–OFF PRODUCT DATA

Nineteen Thermal Cut–offs (also known as Thermal Fuses) are now included in the NTE product line. They are miniature, NON–RESETTABLE temperature sensitive devices designed to prevent appliances and electronic equipment from overheating.

Literally thousands of different applications have been devised for thermal–cutoffs, thus providing a large replacement market. Such applications include:

- Hair Dryers
- Refrigerators
- Battery Chargers
- Irons
- Hot Plates
- Glue Guns
- And hundreds of others
- Window Fans
- Coffee Makers
- Microwave Ovens
- Popcorn Poppers
- Dishwashers
- Electric Motors

The TCO (Thermal Cut–Off) responds to temperature by interrupting an electrical circuit when the operating and/or environmental temperature exceeds the thermal rating of the device. This is accomplished when the internal organic pellet experiences a phase change, allowing the spring activated contacts to permanently open the circuit.

FEATURES:

- Maximum Current Rating: 15 Amps
- Typical Opening Temperature Tolerance: +0°C, –4°C
- 18 Guage Solid Copper Wire
- Full 1 1/3 " leads to fit all replacement configurations
- All types meet the requirements of Underwriters Laboratories Specifications and CSA.
- Each device comes packaged with 2 crimp splices for solderless connection (Poly–bag or Carton pack orders only).

Note 1: Color Band does not denote temperature group.
Note 2: The electrical resistance of the NTE series thermal cut–off is comparable to that found in an equal length of 18 gauge solid copper wire. With proper air flow, heat generation below 15 Amps is minimal, above 15Amps the upper limit on the current capacity will depend on the environment for each specific application.

DEFINITIONS AND ENGINEERING DATA

Theory of Operation:

Crystal resonators derive their basic frequency selective capability from a mechanical vibration resulting from a piezoelectric effect in the material. Although the theoretical analysis of this piezoelectric effect is a relatively complex electro–mechanical function, it can be shown as a simple eqvivalent circuit, as illustrated in Figure 1.

Figure 1
Equivalent Crystal Circuit

Equivalent Crystal Circuit:

The equivalent crystal circuit is useful in explaining the electric characteristics of a crystal operating near its fundamental resonant frequency. The static capacitance, C0, is the capacitance measured from pin to pin which includes the crystal electrode, mounting structure, and holder. R1, C1, and L1 are known as the motional arm of the circuit. C1 represents the motional capacitance of the quartz; L1 is the motional inductance, a function of the mass; and R1 represents the equivalent motional arm resistance.

Series Resonance:

When a crystal is operating at series resonance (fs), it looks resistive in the circuit. Thus its impedance at fs is near zero. In a well designed series resonant circuit, correlation is not a problem and load capacitance does not have to be specified.

Figure 2
Series Resonance

Parallel Resonance (Anti–resonance)

When a crystal is operating at parallel resonance (fa), it will look inductive in the circuit. The crystal's impedance reaches its peak at fa. A change in circuit reactance values will have the effect of pulling the frequency of the crystal. If the crystal is to be used at parallel resonance, the load capacity should always be specified. Load capacity is the dynamic capacity of the total circuit measured or computed across the crystal terminals. In parallel circuit design, the load capacity should be selected to operate the crystal at a stable point in the fs–fa reactance curve (as close to fs as possible)

Figure 3
Anti–Resonance/Parallel

Frequency Tolerance:

The frequency tolerance is the maximum allowable deviation from nominal frequency at a specified temperature. It is normally specified in parts per million (PPM), or % 0f nominal frequency.

INFRARED–LIGHT–EMITTING DIODES

The infrared–light–emitting diode emits radiation in the near infrared region when forward bias current (I_F) flows through the PN junction. The light output power (P_O) is a function of the drive current (I_F) and is measured in milliwatts (mW).

Infrared–light–emitting diodes are used together with photosensors.

PHOTOSENSORS

Silicon photosensors respond to the entire visible radiation range as well to the near infrared radiation range. The radiation response of a photosensor is a function of the material and the diffusion depth of the light–sensitive PN junction. All silicon photosensor (diodes, transistors, darlingtons, triacs) show the same basic radiation frequency response which peaks in the near infrared radiation range.

Photodiodes

Radiation falling at the PN junction will generate hole electron pairs which cause the carriers to move, thus causing a current flow (I_L). The power density of the radiation H (measured in mW/cm^2) determines the current flow, I_L. At zero radiation, a small leakage current, called dark current (I_D) will remain.

Phototransistors

The phototransistor is a light radiation controlled transistor. The collector base junction is enlarged and works as a reversed biased photodiode controlling the transistor. The collector current, I_L, depends on the radiation density (H) and the DC current gain of the transistor. Under dark condition, the transistor is switched off; the remaining leakage current, I_{CEO}, is called collector dark current.

Photodarlingtons

The photodarlington works on the same principle as a phototransistor. The collector base junction of the driver transistor is radiation sensitive and controls the driver transistor. The driver transistor controls the following transistor. The darlington configuration yields a high current gain which results in a photodetector with very high light sensitivity.

Phototriacs

The gate of the phototriac is radiation sensitive and triggers the triac at a certain specified radiation density (H). At dark condition, the triac is not triggered. The remaining leakage current is called peak blocking current (I_{DRM}). The device is bilateral and designed to switch AC signals.

OPTOISOLATORS

An optoelectronic isolator contains both an IRED and a photodetector in the same package, arranged so that the energy radiated from the IRED is efficiently coupled to the detector through a clear, isolating dielectric. An opaque material surrounds the dielectric and provides ambient light protection.

Since there is no electrical connection between input and output, and since gallium–arsenide emitters and silicon detectors cannot reverse their roles, a signal is able to pass through the isolator in one direction only. To a degree determined by the package input–output capacitance and dielectric characteristics, the device is unresponsive to common mode input signals and provides input circuitry protection from the output circuit environment. Ground loop preventions, DC level shifting, and logic control of high voltage power circuitry are therefore typical areas where isolators are very useful.

The measure of an isolator's ability to efficiently pass a desired signal is most commonly referred to as Current Transfer Ratio (CTR). It is dependent upon the radiative efficiency of the IRED, the spacing between the IRED and the detector, thew area and sensitivity of the detector, and the amplifying gain of the detector. It is subject to the nonlinearities (current, voltage, temperature) of both chips, causing a rather complex transfer function which should be evaluated closely when used at non–specified conditions.

The ability of an isolator to provide standoff protection is usually expressed as an Isolation Surge Voltage and is essentially a measure of the integrity of the package and the dielectric strength of the insulating materials.

SLOTTED COUPLERS/INTERRUPTERS

A slotted coupler consists of a gallium arsenide infrared emitting diode facing a silicon photodetector in a molded plastic housing. A slot in the housing between the emitter and the detector provides a means of interrupting the signal. NTE offers several popular standard housings.

DISCRETE LED SELECTING MADE EASIER

THEORY

Although light emission from a semiconductor junction had long been speculated, the first commercial devices did not become available until about 1963. This light emission phenomenon can be explained in terms of Semiconductor Energy–Band Theory. An external voltage applied to forward–bias a PN junction excites the majority carriers (electrons), causing them to move from the N–side Conduction Band to the P–side Valence Band. In making this transition the electrons cross the Energy Gap, E_g, that separates the two Bands, and so have to give up energy in the form of heat (phonons) and light (photons).

ELECTRICAL CONSIDERATIONS

Most incandescents are rated in terms of voltage; LED's, on the other hand, are current–dependent devices since they are basically diodes. When operating from constant–voltage sources, protection should be provided by incorporating a current–limiting resistor with each LED.

Basic DC Circuit

For the simple circuit shown below the resistor value can be calculated from

$$R_L = \frac{V_{CC} - V_F}{I_F}$$

where V_F and I_F are taken from an LED Data Sheet. The power rating required for the resistor should also be kept in mind.

See Diagrams, beginning on Page 1–112

AC Operation

LED's should be operated in the forward direction only. Therefore, the LED circuit must provide reverse–voltage protection if applied voltage is expected to exceed the V_R maximum rating of the LED. The example below shows a circuit having an ordinary silicon diode (e.g., NTE519) placed "back–to–back" with the LED.

OPTICAL CONSIDERATIONS

Lens Effects

Lenses of the earliest LED's were designed to pass maximum light in the forward direction, i.e., perpendicular to the mounting surface. Later LED's produced more light and their lenses were designed to spread light over a wider area, thus permitting broader observer viewing angles. Still later, as higher light output LED's became available, a variety of red–colored, epoxy lenses came into use. These lenses act to diffuse light into a broader apparent emitting area. LED lenses that produce a broad, evenly–diffused light are generally assumed to be more pleasing to the eye than the lenses that produce a highly–intense point of light.

Colors

LED's are now available in various colors. In some applications the designer may be called upon to develop circuits in which LED's of different colors are to produce equal Brightness. Since light output from an LED is basically a function of current flow through the PN junction, equal Brightness can be achieved by adjustments of current flow.

Infrared LED Sources

Visible–emitting LED's, the vital link in the man–machine interface, are characterized in terms of Photometric quantities. On the other hand, infrared–emitting LED's (whose invisible light is of wavelengths longer than 750 nanometers) are characterized in terms of Radiometric quantities. Also, applications requirements for infrared LED sources are different from those for visible–emitting LED's. Whereas for visible–emitting LED's a wide viewing angle is normally important, for infrared sources a narrow beam width and high on–axis intensity are normally important.

All NTE Photon Coupled Interrupter Modules are manufactured using a gallium arsenide emitting diode coupled to a silicon phototransistor or darlington. The gap in the housing provides a means of interrupting the signal with an opaque material thereby switching the output from an "ON" into an "OFF" state.

DESCRIPTION:

The NTE3090 consists of a gallium arsenide IRED optically coupled to a high–speed integrated detector with Schmitt Trigger outputs. Designed for applications requiring electrical isolation, fast response time, noise immunity and digital logic compatability such as interfacing computer terminals to peripheral equipment, digital control of power supplies, motors and other servo machine applications.

THERMO PADS

NTE's THERMO–PADS do away with the old fashioned mica wafer and conductive grease method of mounting power semiconductors. These thermally conductive insulators offer low heat transfer resistance while still providing high electrical isolation between the parts of the assembly. The elastomeric material combines the electrical isolation of rigid insulators with the ability to conform to rough surfaces and reduce contact resistance in much the same manner as thermal greases. Proper selection and use of these THERMO–PADS results in a securely–mounted power semiconductor and minimum resistance to the heat transfer between it and the heat sink.

NEV, NEH SERIES

SUBMINIATURE
(NEV: Radial Lead, NEH: Axial Leads)

The NEV and NEH series subminiature aluminum electrolytic capacitors are especially suitable for applications requiring high capacitance, low cost, and very small size. In fact, you'll find these capacitors in some of the most demanding applications, from precision medical electronics and automobiles to the newest personal computers and disk drives.

They operate over a broad temperature range and are available in either blister pack or bulk.

NPR, NPA (Non–Polarized) SERIES

SUBMINIATURE NON–POLARIZED (NPR: Radial Leads, NPA: Axial Leads)

The NPR and NPA Series subminiature aluminum electrolytic capacitors are especially designed for use in circuits whose polarity is reversed or unknown or in crossover networks which do not require tough characteristic requirements.

MOTOR RUN CAPACITORS

MRC SERIES

The MRC series is a range of AC metallized capacitors. These capacitors are most often used in motor run, HVAC, lighting, and power supply applications.

FEATURES:

- .25" 4–Way Quick Connect terminals
- Pressure activated circuit interrupter
- Self healing of shorts due to dielectric breakdown
- Non–PCB dielectric fluid
- Low dissipation factor
- Leak–proof terminals

RATINGS

Capacitance Range:

370 Volts – 2mfd to 50mfd

440 Volts – 2mfd to 60mfd

Tolerance: ±10%

PERFORMANCE SPECIFICATIONS

Operating Temperature Range: –55°C to +70°C

Capacitance Change Due To Temp: +5% to–7%

Dissipation Factor: 0.2%

Service Life: *150,000 hours (at Max Rating)
94% survival

Impregnant: Dykanol XK

CAPACITOR CONSTRUCTION

Metallized electrodes on both sides of paper substrate are wound with polypropylene film as a dielectric. During vacuum fluid processing the paper acts as a wick for thorough fluid impregnation to SUPPRESS CORONA and to promote long life.

MOTOR START CAPACITORS

MSC SERIES

The MSC Series is a range of AC electrolytic capacitors. These capacitors are most often used to provide the torque necessary to start AC motors and in other intermittent AC applications.

FEATURES:

- Two .25" Quick Connect terminals
- Round moisture and oil resistant plastic case
- 110VAC to 330VAC
- Quick disconnect terminals
- Recessed terminals
- Long life and high reliability

RATINGS

Capacitance Range:

110/125 Volts – 21mfd to 1200mfd

220/250 Volts – 21mfd to 324mfd

330 Volts – 21mfd to 259mfd

PERFORMANCE SPECIFICATIONS

Operating Temperature Range: –40°C to +65°C

Power Factor: 10% Max.; 12% ≤30mfd

Operating Frequency: 47 – 60H_Z

MOUNTING

Vertical mounting of the capacitor with the terminals up is recommended. However, horizontal mounting is acceptable providing the vent is located in the up position. Vertical mounting with the terminals down is not recommended because the capacitor life may be reduced and the operation of the pressure relief vent impaired.

CLEANING

Solvent residues on the capacitors after cleaning may penetrate the seal and cause internal corrosion resulting in shortened life. Alcohol or water detergent cleaning is not usually harmful but halogenated cleaning solvents are not recommended and should be avoided.

SAFETY

Because the watt–second value of these capacitors is high, precautions should be taken during the testing of these devices.

Discharge resistors should be specified when there is a possibility of a residual charge left on the capacitor or to protect contacts. Mis–application, such as exceeding design limits or applying continuous AC voltage, may result in destruction or explosion of capacitors.

CEILING FAN CAPACITORS

CFC SERIES

The CFC series is a range of metallized polyester film capacitors designed expressly for ceiling fan use. They are a self–healing flat capacitor winding with polyester film dielectric. They are mounted in a flame retardent plastic case with an epoxy resin end–seal. The CFC series are also used in other electric fans and in fluorescent lamps.

The NTE CFC series is available in 2 wire (single) and 3 wire (dual) capacitor versions.

FEATURES:

- Small size/light weight
- High Insulation resistance
- Small dissipation factor

NTE539 = When replacing part numbers 530165–12, MH1011B01, and MH1031C01 with NTE539, cut the "G" lead at the surface of the failed multiplier. Strip and connect to the "G" terminal of the replacement multiplier.

NTE1081A = When an NTE1081A is used to replace a UPC563H, the following modifications must be performed:

1. The 680Ω resistor from Pin3 and Pin4 along with Diode SD45 or 1S953 must be removed.
2. The 10kΩ resistor at Pin9 must be removed.
3. The 220pF capacitor must be changed to 47pF. This capacitor is located between Pin4 and Pin5.
4. Connect the heat sink fin to ground.

The NTE1081A directly replaces the UPC563H2 just by grounding the heat sink.

NTE1091 = To replace a UPC48C with an NTE1091, connect a 3.3kΩ, 1/2W resistor between Pin15 and ground.

NTE1140 = To replace a UPC575C with an NTE1140, the following modifications must be performed:

1. If there is a resistor between Pin5 and Pin6, remove it.
2. Remove any existing resistor between Pin8 and ground.
3. Connect a 47µF capacitor from Pin8 to ground.

NOTE: There are no required modifications when replacing a UPC575C2 with an NTE1140.

NTE123A = To replace a 13–17–6 transistor with an NTE123A, place a 15kΩ resistor from the base of the NTE123A to ground.

NTE1218 = The STK413 and STK415 are discontinued devices and are not directly replaceable. To replace these devices with an NTE1218, the following modifications must be performed (See Figure 1):

1. Pin6 (L Ch) and Pin12 (R Ch) must be disconnected from their loads. In some cases, this may involve cutting out a section of foil on the PC board.
2. The 15Ω resistors in series with the capacitors from Pin2 to ground and from Pin14 to ground must be removed and replaced with 120Ω resistors.
3. A 12kΩ resistor must be placed between Pin2 and Pin5, and a 12kΩ resistor must be placed between Pin11 and Pin14.
4. Between Pin5 and Pin6, connect a 47µF, 16V capacitor, and between Pin10 and Pin11, connect a 47µF, 16V capacitor.

Figure 1

NTE1115A = The TBA810S–H is replaced by an NTE1115A with the following change: A 100Ω, 1/4W resistor must be connected between Pin1 and Pin4.

NTE159 = Two (2) NTE159 transistors may be used to replace a UPA41C. (See Figure 2)

◀ NTE parts are quality tested to consistently assure that MROs and OEMs receive parts that meet or exceed industry specifications.

QUALITY

◀ NTE's warehouse is stocked with substantial supplies of each of our parts to provide off-the-shelf availability.

▲ NTE blister-packs products in attractive eas identify packaging to provide eye-catching in-s merchandising.

◀ NTE's Technical Services Department constantly updates literature to provide end-users with the most current technical assistance on all components in the vast NTE line. For technical assistance, call 1-800-631-1250 nationwide.

NTE's responsive service force uses sophisticated order processing and inventory control systems to shorten turnaround time and provide customers with real-time information. ▶

SERVICE

◀ NTE has grown from a company with ten parts in its line to one of the nation's top semiconducto suppliers offering over 3,550 components.

VALUE

◀ NTE's 35,000 square foot headquarters in Bloomfield, NJ houses under one roof, all the essential services and inventory to continually supply replaceme components to distributors in th United States, Canada, Latin America, the Caribbean, Europe and the Middle East.

NTE'S NEW SOFTWARE

QUICK Cross™

"*QUICK Cross*" is the industry's first PC-based software cross-reference to NTE's highly successful line of semiconductors and relays!

Just type in any of a quarter of a million industry device numbers — U.S., Japanese, and European — and you'll get the ideal replacement from over 4,750 NTE devices *in about one second!*

All NTE parts carry a two-year warranty and most are available off the shelf.

"*QUICK Cross*" 5¼" and 3½" floppy diskette MS-DOS versions are available direct from NTE or through your local NTE distributor. For your nearest one, call NTE toll-free 1-800-631-1250 (including Canada) or (201) 748-5089. FAX: (201) 748-6224.

USING THE NTE CROSS REFERENCE GUIDE

NTE uses its own simplified computer sorting system. Parts starting with the a letter precede those starting with a number.

Example: A thru Z, then 0 thru 9

1. Parts starting with a decimal point or any other special characters are listed first:

   EXAMPLE: .4M4.3AZ5
   .7J2100
   .MZ110B
   (IR) 2SB187

2. Parts starting with a letter are listed in alphabetical order of the letters occurring before a dash or number:

   EXAMPLE: MPS–A56
   MPSA56

3. Parts starting with a number are listed in order of the numbers occurring before a dash or letter:

   EXAMPLE: 1D6
   1M3.6AZ5
   1N4331

4. Devices beginning with a . (decimal point) may be found on the first page (2–2) of this cross reference.

5. Some part numbers frequently misread are:

   A. Zero for the letter "O" and vice–versa
   B. One for the letter "I" or vice–versa
   C. The Greek letter (μ) may be found under (U)

6. The following are special notes which may appear after the NTE replacement number:

   + Rotate device 180 ° to conform with original lead configuration.
   @ Minor mechanical difference exist, but device will fit most applications.
   # Minor electrical difference exist, but device will function in most applications.
   * Lead configuration may vary from the original device. Consult technical section for device outline.
   ( ) More than one device is required to replace the original.
   $ NTE1570 is for transistor tuner only. If unit contains an FET tuner, use NTE1572
   % Must us the insulating hardware supplied.
   & Refer to Special replacement section on page. 1–355
